

Did you know?

...that obesity might be associated with an increased incidence of Crohn's disease (CD)?

In a pooled analysis of 5 prospective cohorts from 9 western countries, obesity* was associated with an increased risk of incident CD but not UC¹

Among 601,009 participants (age range: 18–98 years) with 10,110,018 person-years of follow-up, every 5 kg/m² increase in BMI was associated with:¹

The global prevalence of obesity has nearly tripled since 1975, which could be a key contributor to the increasing incidence of CD worldwide^{1,2}

aHR: adjusted hazard ratio; BMI: body mass index; CD: Crohn's disease; UC: ulcerative colitis
*Defined as BMI ≥ 30 kg/m²
